

## Exercise Ex 3

### Selecting from a Stored Procedure with multiple result sets and Output Parameters

Use the bikeshop tables we created earlier

Write a customer summary stored procedure to summarise a customer's orders and their total spend with the company

The report should contain 3 sections.

- 1) A header with the customer's first name and last name, their email address and their city and state and phone number
- 2) The orders section should contain order\_id the order date and the total order cost value
- 3) Finally return their total spend as an output parameter.

Format the results as a report in Python

Who are the top 3 biggest spenders with the bikeshop ?
